arachidonic acid	$C_{19}H_{31}COOH$	4	$CH_3(CH_2)_4(CH=CHCH_2)_3CH=CH(CH_2)_3COOH$

TO FIND  $N(C=C)$  IN A FATTY ACID TAIL, USE:

$$N(C=C) = C - \frac{H-1}{2}$$

(eg) ARACHIDONIC ACID  $C_{19}H_{31}COOH$

$$N(C=C) = 19 - \frac{31-1}{2} = 4$$

### 11. Heats of combustion of common fuels

The heats of combustion in the following table are calculated at SLC (25 °C and 100 kPa) with combustion products being CO<sub>2</sub> and H<sub>2</sub>O. Heat of combustion may be defined as the heat energy released when a specified amount of a substance burns completely in oxygen and is, therefore, reported as a positive value, indicating a magnitude. Enthalpy of combustion, ΔH, for the substances in this table would be reported as negative values, indicating the exothermic nature of the combustion reaction.

VERY USEFUL INFO

NOTHING AQUEOUS COMBUSTS (ACCORDING TO VCAA)

### 12. Heats of combustion of common blended fuels

Blended fuels are mixtures of compounds with different mixture ratios and, hence, determination of a generic molar enthalpy of combustion is not realistic. The values provided in the following table are typical values for heats of combustion at SLC (25 °C and 100 kPa) with combustion products being CO<sub>2</sub> and H<sub>2</sub>O. Values for heats of combustion will vary depending on the source and composition of the fuel.
